

Remanufacturing explained

Highly experienced telecoms remanufacturer

MF Communications has been supplying quality telecoms products for over 16 years.

Remanufacturing quality

MF Communications has an extensive range of telecoms equipment that has been completely remanufactured by our specialist team. All hardware has the same performance, one year warranty and support options as brand new equipment bought directly from the manufacturer.

Our comprehensive and rigorous remanufacturing process complies with ISO standards and guarantees equipment has come from a trusted and reliable source. We screen all equipment to ensure there are no counterfeits and all equipment is fully verified, with a tracked product service history.

Remanufactured, not just refurbished

This is not a 'used' or 'outdated' solution. In MF Communications' remanufacturing process, equipment is not just polished and made to look in good condition.

It is cleaned and reconditioned to as-new status, replacing casings, hand pieces, buttons, and DESI strips, as required. Firmware and hardware upgrades bring the product up to date with the latest version.

Rigorous remanufacturing process

All equipment is remanufactured with new parts and tested a number of times in a controlled environment. MF Communications is BS EN ISO 14001 compliant as being an environmentally responsible organisation. All parts are responsibly sourced and recycled where appropriate. We perform diagnostic, functional, and network traffic system testing on all remanufactured products. This includes safety and regulatory tests.

Quality Assurance Certified

MF Communications applies strict quality assurance standards to which all remanufactured equipment must comply. Periodic audits ensure these standards are constantly adhered to.

When might you want remanufactured equipment?

- To maintain a current system or platform that has been discontinued
- To purchase a lower value option for reliable software testing or training environments
- To fit in with smaller budgets but still want the latest software and up-to-date systems
- When the latest technology is not required

Please note: MF Communications does not hold accreditation for HiPath DX/Realitis/ISDX products and does not and will not upgrade or alter any existing these Unify products.

Quality Guaranteed Certified Remanufacturing Processes

- **Cleaning:** all equipment is cleaned and initially assessed. Removal of old labels occurs, as well as fasteners and panels. Casings are cleaned or replaced as applicable.
- **Screening:** all equipment undergoes thorough screening and physical testing at various stages of the process.
- **Upgrades:** software and hardware upgrades ensure all remanufactured models comply with later release equipment.
- **Restoration:** each unit is returned to its default settings, with removal of previous owner information.
- **Testing:** diagnostic, functional, and network traffic system tests carried out at every step of the process.
- **Repair:** replacement of faulty components and boards occurs where applicable before further testing to assess function.
- **Packaging:** all remanufactured equipment comes re-boxed, as new, placed in a sealed, protective shipping box ready for delivery, complete with a one year warranty.
